Gender

> Information targets the latest **supported** release. For legacy (older) versions and bug fixes, read the changelogs.

Introduction

Gender is a data value assigned to all horses, even if untamed. It is part of a simple breeding feature.

Identifying Gender

Gender is viewed in the horse inventory for **tamed** horses, or as an icon above nametagged horses (inc. untamed and foals).

Gender Potions

> Lite does **not** include infertility potions for geldings (or infertile mares).

Gender can be changed using gender potions, or via commands.

Gender Differences

There are no gender-specific differences in appearance, behavior or gameplay functions. Gender is only relevant to breeding.

Additional

Gender data can be revealed via command if the player has access.

`/data get entity @e[type=swem:swem_horse,sort=nearest,limit=1] Behaviors[9].Female`

Output will show the gender icon of the horse, and the value `1b` for female, or `0b` for male.
